

NextHello: AI-Powered WhatsApp Outreach

Real-time multi-agent orchestration powered by OpenClaw reasoning and content generation – built for teams managing follow-ups who need consistency and scale.

Multi-Agent Swarm

OpenClaw Intelligence

WhatsApp-Native

Executive Summary

What the Platform Does

- Ingests live WhatsApp conversations in real time
- Orchestrates specialized AI agents across the full follow-up workflow
- Uses OpenClaw for model inference and response generation
- Persists every interaction for auditability and relationship sync

Business Outcomes

Faster Interaction Handling

Automated first response in under 10 seconds

Personalization at Scale

Context-aware messaging for every contact

Shorter Follow-Up Time

Contact prioritization to outreach without manual handoffs

The Problem with Today's Follow-Up Workflows

Slow Manual Response Cycles

Teams manually track follow-ups across WhatsApp, losing engagement to faster, automated interactions.

Inconsistent Contact Prioritization

Relationship quality depends on manual effort – not on a reliable, repeatable process.

Fragmented Tooling

Personalization, media delivery, and relationship data updates live in separate, disconnected tools.

Zero Automation Visibility

No clear audit trail of which follow-up action occurred, when, and why.

- ❑ **The need:** One orchestrated system that reacts in real time, handles every follow-up workflow step, and logs everything for traceability.

Solution Architecture at a Glance

Each layer has a single, well-defined responsibility – keeping the follow-up management system modular, observable, and easy to extend as requirements for relationship maintenance evolve.

Live Demo !

Core Components

WhatsApp Bridge

Message ingress and outbound delivery – the entry and exit point for every conversation.

FastAPI Service

Orchestration endpoints and admin APIs that normalize, validate, and route all events.

CrewAI Swarm

Autonomous agent lifecycle management – research, prioritize, personalize, and relationship-update in parallel.

Data Layer

PostgreSQL for durable history. Redis for low-latency swarm state. Both always in sync.

Admin UI

React + ReactFlow + SSE live stream for real-time orchestration visualization.

How NextHello Talks to OpenClaw

Inference Request Flow

01

Message Arrives

Contact message received from WhatsApp; coordinator emits event to relevant agent.

02

Context Assembly

Agent builds prompt from conversation state + contact enrichment fields.

03

OpenClaw Inference

Request routed via CrewAI LLM(model=...) using shared LLM_PROVIDER config.

04

Parse + Emit

Structured or free-form output drives contact prioritization, messaging, or relationship updates – then propagates downstream.

What OpenClaw Powers

Contact Prioritization

Engagement scoring and routing logic generated per conversation

Personalized Messaging

Dynamic message copy tailored to contact context

Content & Script Generation

Agent-authored follow-up scripts and interaction sequences

End-to-End Inference Loop with OpenClaw

[/https://youtu.be/qtVW4goCNnk](https://youtu.be/qtVW4goCNnk)

Every inference call is traceable end-to-end – from the raw WhatsApp message to the final database update – enabling complete auditability across the automation loop for relationship management.

Real-Time Observability Built In

What You Can See

- **Live SSE stream** feeds dashboard updates as events occur
- **ReactFlow graph** shows coordinator, agents, and active contacts
- **Agent activity log** captures status, action, timing, and correlation IDs
- **Swarm state snapshots** support replay and troubleshooting

Why It Matters

Faster Debugging

Pinpoint failures in the event chain instantly

Better Trust

Teams can verify follow-up automation behavior without reading logs

Easier Handoff

Engineering and ops share a single source of truth for relationship management

KPIs, Roadmap & Next Steps

Target KPIs

- **First-Response Latency**
Target: under 10 seconds from inbound message to automated action
- **Prioritization Completion Rate**
Percentage of contacts categorized without human intervention
- **Engagement-to-Resolution Rate**
Managed contacts advancing to successful resolution

📌 **Impact goal:** Increase follow-up completion rate while reducing manual effort per contact.

Roadmap

Why NextHello Wins

Real-Time Orchestration

Multi-agent swarm reacts in seconds, not minutes

Full Observability

Every action logged, visualized, and replayable

OpenClaw Intelligence

Centralized LLM layer – swap models without rewriting logic

Measurable Outcomes

Follow-up completion rate up, manual effort per contact down
